

ABSTRACT

A disposable absorbent article including a wetness sensation member and visible highlighting-indicating (3
the presence of the wetness sensation member to facilitate an opportunity for the toilet training of the (30
wearer. The wetness sensation member includes a permeable layer and a flow control layer. Urine (45
deposited on the wetness sensation member can penetrate through the permeable body-facing layer in a (41
direction away from the wearer to the flow control layer. The flow control layer retards the passage of (79
the urine through the wetness sensation member in the z direction while supporting the movement of the (26
urine in an x-y plane to increase the wetted area contacting the wearer's skin and thereby enhance the (114
wearer's awareness that urination has occurred. The visible highlighting is visible when viewing a body- (129
facing surface of the article and may be associatively correlated with an externally visible marking and/or (45
with the concept of toilet training. (51
